Answer - Fancy Hotel B

```c
#include <stdio.h>
#include <stdlib.h>
#include <ctype.h>
#include <string.h>
#include <math.h>

int main()
{
        int n,m,x;
        x=scanf("%d %d",&n,&m);
        if(x<0)
                {
                        return 1;
                }
        int gender[n][m];
        for(int i=0;i<n;i++)
                {
                        float male=0,female=0,none=0;
                        for(int j=0;j<m;j++)
                                {
                                        x=scanf("%d",&gender[i][j]);
                                        if(x<0)
                                                {
                                                        return 1;
                                                }
                                        if(gender[i][j]==1)
                                                {
                                                        female++;
                                                }
                                        else if(gender[i][j]==0)
                                                {
                                                        male++;
                                                }
                                        else
                                                {
                                                        none++;
                                                }
                                }
                        printf("%f %f\n",(male/m)*100,(female/m)*100);
                }
}
```
